Individual walking elements with variable depth manage to find good grip on dry, wet and winter seasons. These running elements ensure frequent road connectivity throughout the year and guarantee a safe performance. High zero ratio makes hydroplanning impossible to eliminate water and mud from under the footprint. Tires are pinned to studs, which can be added to the walk and increase snow and snow-covered road traction. Maintained road connectivity makes the driving experience safer in all situations. Walking pattern actively increases soil terrain traction. All moving elements work together to maintain a firm grip on the surfaces of soft and loose terrain, even in deep mud and sand. Trade design has a high zero ratio, large, independent walking blocks, stone ejectors and side-biters. They hold the road of tires all the time, further upgrading the off-road performance of the tire. Special side-biters are located on the upper sidewall and they, along variable shoulder trade block edges, improve traction and road grip on deep and loose terrain surfaces. The tire protects its casing from damage. Its self-cleaning nature manages to eliminate soil and ice and take out rocks trapped among its moving elements. This keeps the tyre road connectivity at all times and prevents stone retention, which can damage the tyre casing. In addition, the strong tire compound effectively prevents off-road damage from injuring the casing by resisting puncture, cut and friction. In this way, the tire is more durable against the rough off-road terrain. The center blocks of trade design continuously maintain the road connectivity of the tire. Improved road connectivity improves steering responsiveness and driving stability. The steering becomes faster and more accurate, while the structure is secured against the drive. Improved road connectivity also manages to distribute driving pressure with the equally walking area. Acceleration, corner and braking, hard, wear-resistant compound as well as equally spreading forces of acceleration, cornering and braking significantly increase the usefulness of walking life and tires. The intended purpose of the soil terrain tire type is off-road use. They are not designed for regular highway driving. The actual product may vary coursr MXT is an extreme off-road dirt terrain tire perfect for lightweight truck owners and extreme Demanding aggressive off-road traction and excellent handling on the highway. MXT sports an attractive side biter design and wider, deep-running grooves for better off-road mud and ice traction performance. The amount of rubber on the road is optimized to provide excellent extreme terrain traction and increased driving feel, while the aggressive, deep side biter design enhances off-road traction, and sidewall abrasion resistance. Oysters provide soil-scoop effects for better off-road traction. The traction edges on the turn shoulder elements add extra cutting edges for better lateral grip. Wide grooves between the outer running blocks allow the MXT to be easily cleaned, increasing the grip for better traction. Sipping for increased wet traction on the highway also provides additional cutting edges for increased off-road traction. Even half-clad, 80% of MXT sips remain functional, providing a more consistent performance throughout the life of tires.
